AdBlue (Urea) Solutions

In recent years, the European Union has issued directives such as Euro 4 & 5 which require significant reductions in Nitrous Oxide (NOx) emission from diesel engines. Beginning in 2010, the EPA will institute similar regulations for the North American market. To assure compliance with these new standards, several diesel engine manufacturers have implemented Selective Catalytic Reduction Systems (SCR) which injects AdBlue (AUS 32) to the vehicles emissions.

Standard Pump’s unique Pump Packages are engineered to transfer AdBlue (AUS32) directly from barrels and Tote™ tanks. Each Pump Package meets stringent North American and European safety standards to insure the consumer receives a safe and quality product. Extensive testing has concluded that AdBlue reacts negatively to non-ferrous metals such as Copper, Zinc, and related alloys therefore each Standard Pump is constructed with ISO compatible materials.
